

TALKBACK SYSTEM

Talk-Back system is a command communication system based on one operator unit/panel, and a wide range of substations. The system is typically used to coordinate activities in a work group – when it is important that the members in the group can hear all conversations.

The talkback is a microphone-and-receiver system installed in a console for communication between people in the control room. The typical setup includes an internal microphone built directly into the console, and a series of switches. The switches allow selecting zone numbers. Using this tool, the user can communicate with a people and hear back.
